Allowable Subject Matter

The rejections have been overcome by the amendment and remarks and that the pending claims 1, 4-32, 35-43 are in condition for allowance.

The following is an examiner's statement of reasons for allowance of claims 1, 4-32, and 35-43. The above-mentioned claims are patentable because no pertinent prior art could be found which discloses the current limitations of Allowable Subject, the independent claim 1 as amended, and also claims 17, 26 and 30 with similar elements recite the a method for providing an electronic information service in a computer system connected to a network, the method comprising: creating a first information object comprising a partial area of a virtual pixel area into which a plurality of users can write information and from which the plurality of users can read information, said first information object including a position-coding pattern having sufficient resolution to define a track of a drawing device when the drawing device is moved over the position-coding pattern; transmitting the first information object via the network to a first user included in the plurality of the users; receiving a second information object from the first user including a modification of at least part of the partial area of the virtual pixel area, said second information object comprising position information obtained from the position-coding pattern; and updating the virtual pixel area utilizing the second information object, wherein the position information obtained from the position-coding pattern is used to provide a graphical image that is not in text format and which is created by moving the drawing device over the position-coding pattern. The invention includes an electronic information service in a computer system connected to a network and an online graphical message service. The service may create a first information object comprising a partial area of a virtual pixel area into which a plurality of users can write information and from which the plurality of users' card read information. The service may then transmit the first information object via the network to a first user included in the plurality of the users. After receiving a second information object from the first user corresponding to at least part of the partial area of the virtual pixel area, the service may update the virtual pixel area utilizing the second information object, the

service then receives from a first user a request for at least a portion of a graphical image and transmits the portion of the graphical image over a computer network to the first user. In case the service receives over the computer network a modification of the graphical image from the first user, the service may update the graphical image to include the modification and make the updated graphical image available for viewing and modification by a second user. An electronic information service in a computer system connected to a network may receive a message and an indication of a position for the message on a virtual area having a matrix of pixels. After placing the message in the position on the virtual area, the service may make at least portions of the virtual area available for viewing and modification by a second user. In an online graphical message service, the first user's computer may send a request over a computer network to a computer server for at least a portion of a graphical image that is available for modification and viewing by a plurality of users. The first user's computer may then receive the portion of the graphical image over the computer network and display it to the first user, who is included in the plurality of users. The first user's computer may then receive a modification of the portion of the graphical image from the first user, after which it may send the modification over the computer network to the computer server. Regarding above mentioned claims Ludwig et al. (UK Patent Application, GB 2282506), does not teach or suggest the combination of recitations above. Ludwig is instead is primarily concerned with a teleconferencing system that integrates separate real-time and asynchronous networks, the former for real-time audio and video, and the latter for control signals and textual, graphical and other data in a manner which closely approximates the experience of face-to-face collaboration. The system provides an audio/video (AV) path for carrying AV signal among the workstations, a video mosaic generator for combining images, and an audio summer or mixer. The system architecture is readily scalable to the largest enterprise network environments. It accommodates differing levels of collaborative capabilities available to individual users and permits high-quality audio and video capabilities. In the case of a plurality of geographically dispersed LANs interconnected by a WAN the demands made on the WAN are significantly reduced by employing multi-hopping techniques, including

avoiding the unnecessary decompression of data at intermediate hops, as well as video mosaicing and cut-and-paste technology.

For these reasons, the rejection of remaining dependent claims is also withdrawn.
